

The Next Generation in Fuel and Fluid Management Solutions

FluidSecure
Simply Smart & Affordable

What is FluidSecure?

Harnessing the power of the IoT FluidSecure is the next generation in Fuel and Fluid Management Solutions. It is an incredibly cost-effective, easy-to-install, user-friendly, ultra-low-maintenance solution that is revolutionizing the world of Fluid and Fuel Management. With the use of smartphone and cloud technologies FluidSecure offers everything that a traditional system does but at a fraction of the cost and is simple and easy to use.

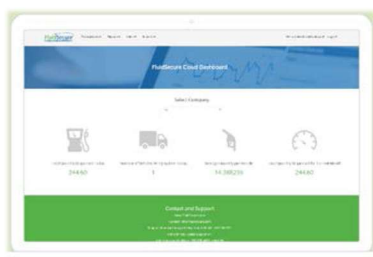

How does it work?

FluidSecure provides SECURITY and ACCOUNTABILITY at your fuel pump. FluidSecure only has 3 components to give you complete control:

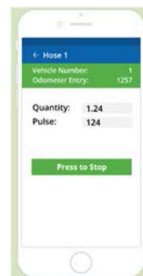

1. LINK

Each Hose is individually controlled by a FluidSecure LINK. The LINK connects with 6 simple wires: 2 to power it, 2 to control the pump's on/off, and 2 to automatically record the quantity dispensed.

3. CLOUD

FluidSecure CLOUD is our easy-to-use fluid management database software. This is where all vehicle, personnel and fueling data is securely stored. The Real Time Dashboard give you complete access to all metrics and allows you to easily generate reports so that you can keep track of every fuel transaction.

2. APP

The FluidSecure APP connects with the requested hose wirelessly with the LINK generating a Wi-Fi direct hot-spot. Once the connection is established, the APP is used to validate the fueler and records the fluid dispensed.

(Optional) HUB

The FluidSecure HUB is a pedestal with a 10" Tablet requiring only power. The Tablet is securely installed inside a free-standing pedestal with a built in Cover, Fan, and Heater to withstand all weather conditions. The HUB can control up to four hoses/LINKs and is ideal for locations where not all drivers have a smartphone. A module can be added to allow use of key fobs, cards or RFID.
